Professional Summary

Computer Engineer with experience in **Full Stack** development (**MERN**) and a **backend** focus using **Node.js/Express**. Able to **design** and **build REST APIs**, integrate services, and take ownership of delivery across the full **software lifecycle** (requirements, implementation, deployment, and maintenance). Interested in **software architecture**, **scalability**, and **code best practices**, eager to contribute to new projects and keep learning.

Professional Experience

OWIUS

2024 – Present

Full Stack Developer

- **Own end-to-end delivery** of **complete projects** across multiple **MERN** applications, implementing **Node.js/Express** services alongside **React** UIs.
- **Design and implement REST APIs**, defining resources, validation, and error handling for maintainable integrations.
- **Integrate end-to-end** components (frontend, API, and database) and support deployment and maintenance flows.
- **Integrate third-party systems** such as **POS / payments** (e.g., **Stripe** or **Redsys**) and **SOAP** services, adapting flows and handling integration errors and incidents.
- Prioritize and deliver multiple concurrent projects, coordinating scope and technical decisions.

Peninsula Corporate Innovation

2020 – 2021

Frontend / Full Stack Intern

- **Develop UI** components with modern **JavaScript** frameworks, improving responsiveness and usability.
- **Collaborate** in team development workflows using **version control** and **code review** processes.

Education

Bachelor Degree in Informatics Engineering (Specialization in Software Engineering)

Faculty of Computer Science of Barcelona - Polytechnic University of Catalonia

2021 – 2025

Higher Vocational Training (DAM) – Multiplatform Application Development

Monlau

2019 – 2021

Technical Skills

Backend

Node.js, Express, REST API design

Programming languages

JavaScript, TypeScript, Java, C#, C++, Python

Frontend

React, Vite, JavaScript, TypeScript

Practices

Agile methodologies, Git, API design, software lifecycle management, problem solving, team collaboration

Databases

MongoDB, PostgreSQL, MySQL

Featured Project

AI Task Board Generator

Full stack project — From idea to task board with local AI

- End-to-end development of an application that converts a natural language description into a **structured task management board** (epics → user stories → technical tasks), integrating with **Trello** and **Taiga**.
- **Backend** built with **NestJS** (Fastify) following a **modular architecture**: separate modules for auth, projects, AI, job queues, board integrations, and RAG.
- **Asynchronous processing** using **BullMQ + Redis**: the generation flow (analysis → epics → stories → tasks) runs as chained steps with structured validation via **Zod** at each stage.
- Integration with **local AI** (Ollama) and a **RAG** pipeline using **Qdrant** as the vector store and **nomic-embed-text** for embeddings, enriching prompts with reference documentation.
- **Frontend** SPA in **React + Vite** with **JWT** auth and real-time processing status visualization.
- Full infrastructure orchestrated with **Docker Compose**: PostgreSQL, Redis, Ollama, Qdrant, and the app.
- Project focused on learning **modern full stack architecture**, integration with **local AI models**, and **asynchronous queue-based processing** patterns.

Languages

Spanish (Native) | Catalan (Native) | English (B2)
